# HaCaT/THP-1 coculture (**COCAT**) model to estimate potency

- Keratinocytes may crucially modulate the strength of chemical-induced DC activation by providing xenobiotic metabolism and releasing DAMPs as well as (pro-inflammatory and anti-inflammatory) cytokines.
- increased dynamic range (dose response) after exposure to sensitizers compared to THP-1 alone.
- Adaptation of protocol to reconstructed human epidermis (RHE) model

***COCAT and RHE/THP-1 results are kindly provided by Brunhilde Blömeke, Trier University, Germany***

Day 5

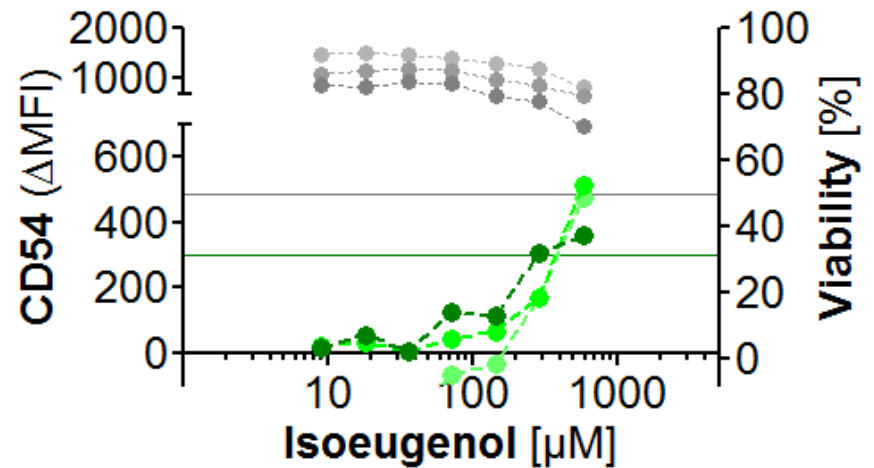

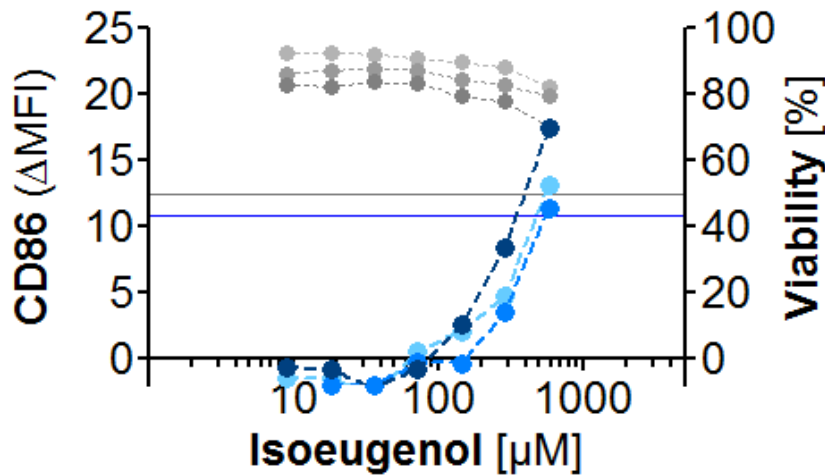

Data analysis

# Results: Example for concentration dependent responses in COCAT: Isoeugenol

● CD86 - run 1      ● viability - run 1  
 ● CD86 - run 2      ● viability - run 2  
 ● CD86 - run 3      ● viability - run 3

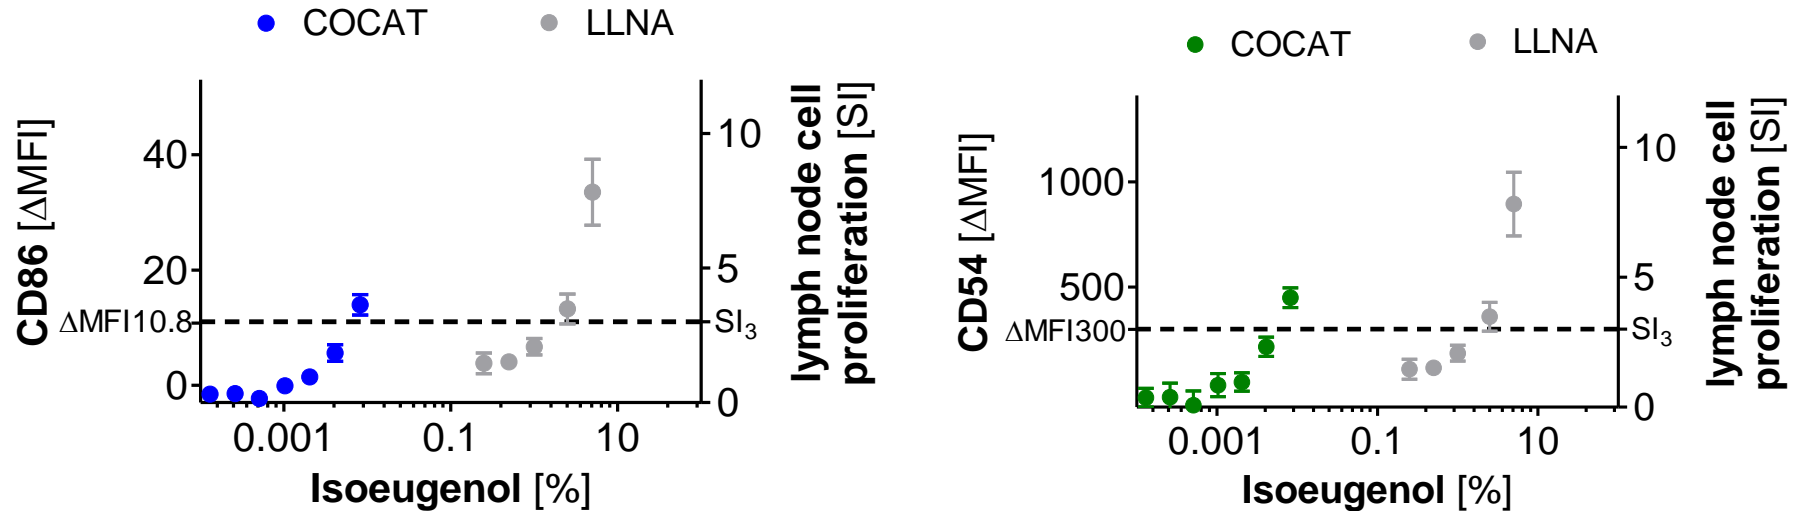

● CD54 - run 1      ● viability - run 1  
 ● CD54 - run 2      ● viability - run 2  
 ● CD54 - run 3      ● viability - run 3

- Concentration-dependent increase of CD86 and CD54 in 3/3 runs
- Reaches thresholds for positivity for CD86 and CD54 at >50% cell viability
- Considered as sensitizer in COCAT

t=24h, 3 individual runs, each shown as mean of triplicates

# Comparison of the estimated skin sensitizing potency in COCAT (E $\Delta$ values) with skin sensitizing potency in LLNA

**Isoeugenol dose response** to estimate skin sensitizing potency in COCAT (expressed as  $\Delta$ MFI (mean  $\pm$  SEM), n=3) and LLNA (n=5, expressed as SI). COCAT concentration range is 0.00015-0.00945% (9  $\mu$ M-576  $\mu$ M), LLNA concentration range is 0.25; 0.5; 1.0; 2.5 and 5.0 % in AOO.

The horizontal dashed line represents the threshold for COCAT at  $\Delta$ MFI=10.8 for CD86 and  $\Delta$ MFI=300 for CD54 as well as the stimulation index of 3 (SI<sub>3</sub>) for the LLNA (Loveless et al., 1996). MFI, mean fluorescence intensity.

# Comparison of the potency in COCAT (E $\Delta$ values) with skin sensitizing potency *in vivo* (LLNA)

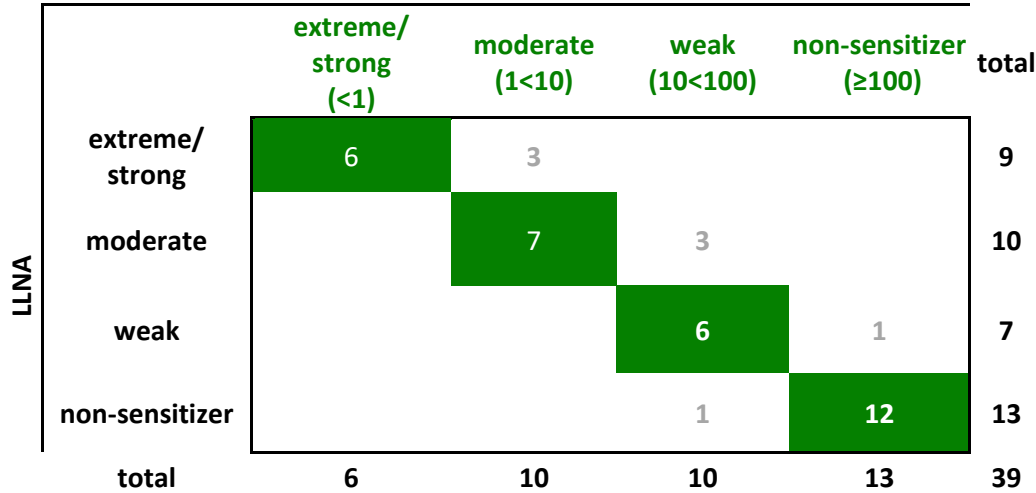

**Association between *in vitro* COCAT E $\Delta$  of CD54 and *in vivo* LLNA**  
(n=5 representative for 26 sensitizers and 13 non-sensitizers).

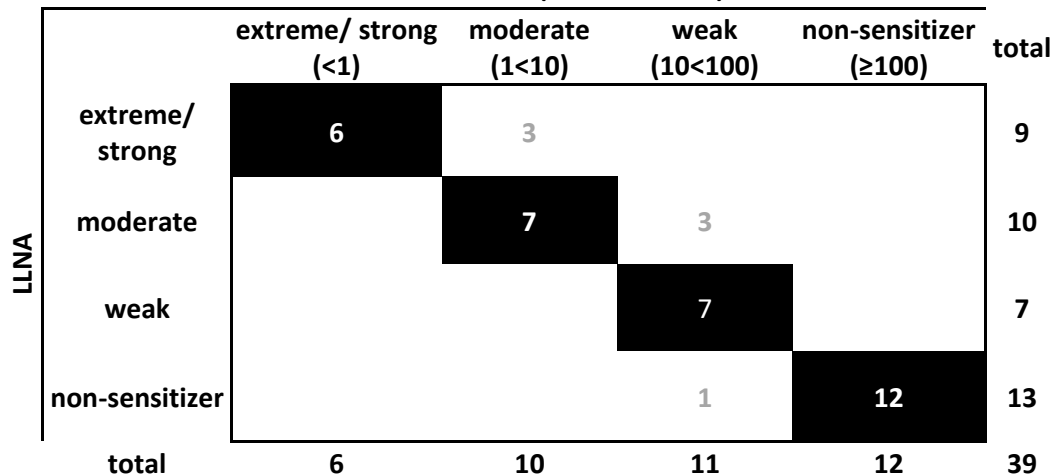

# Classification of sensitizers based on predicted EC3 using ECA $\Delta$ of CD54 or lowest ECA $\Delta$ in COCAT

COCAT ECA CD54

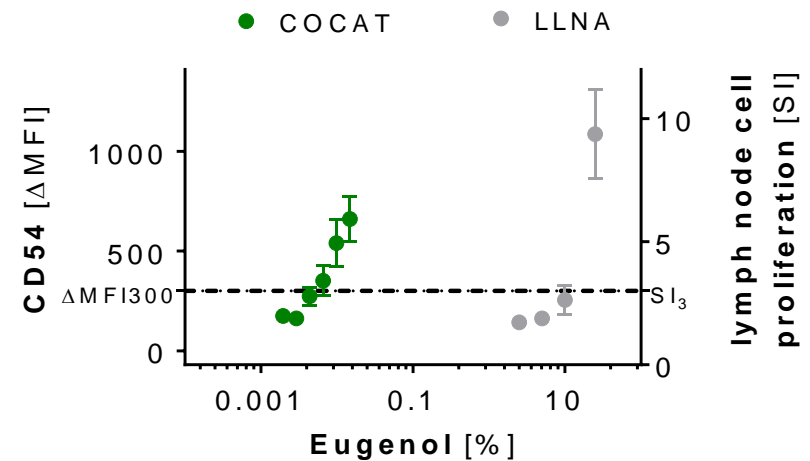

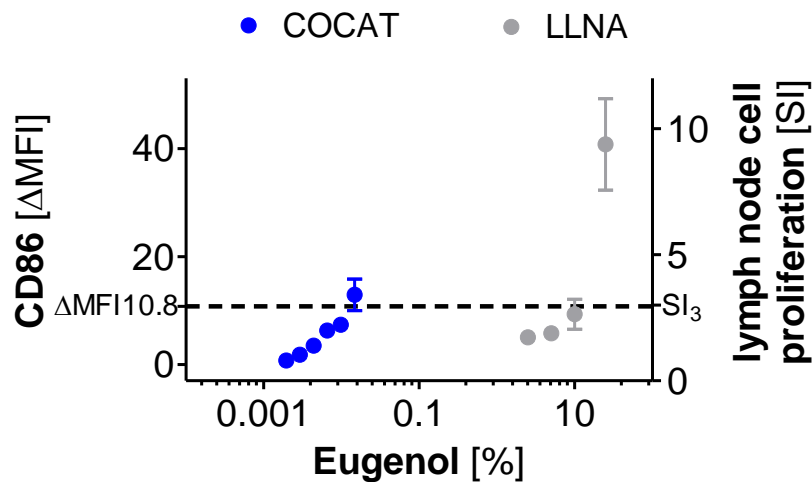

Concordance:  
correctly predicted/total =  $31/39 = 0.79$

COCAT lowest ECA (CD86 or CD54)

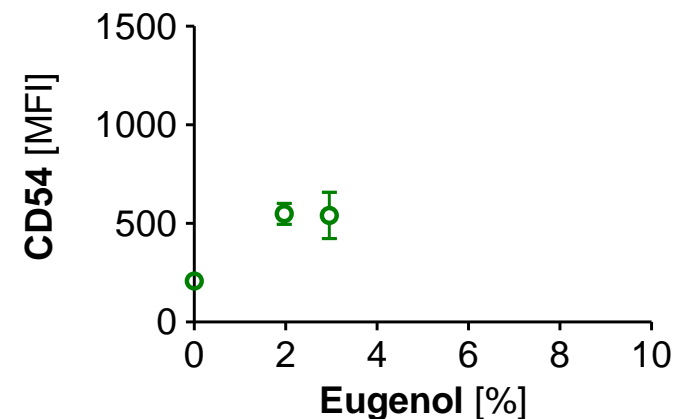

DRAFT caculation  
Concordance:  
correctly predicted/total =  $32/39 = 0.82$

# Eugenol comparison of the estimated skin sensitizing potency in COCAT, LLNA and RHE/THP-1 coculture model

## Reconstructed human epidermis (RHE)

Dose-dependent upregulation of CD86 and CD54 on THP-1 cocultured with RHE after topical exposure of eugenol as mean fluorescent intensity (MFI), values for 2 % (120 mM) and 3 % (180 mM) eugenol ( $n=2$ ,  $t=24$ h, mean  $\pm$  SEM, RHE: SkinEthic, 0.5 cm<sup>2</sup> provided by Episkin). Chemicals were dissolved in 4:1 acetone:olive oil (AOO).

# Calculation of surrogate EC3 values from COCAT

Compound information			COCAT results							
Compound Name	CAS no.	MW [g/mol]	ECΔ [μM]	SEM	Marker for ECΔ	Positive runs	ECΔ [μg/cm <sup>2</sup> ]	ECΔ [μg/ml]	Predicted EC3 [%]	Predicted category
<b>Eugenol</b> (optimisation phase)	97-53-0	164.2	362	107	<b>CD54</b>	3 out of 3	36.9	59.5	<b>10.4</b>	<b>weak</b>
<b>Isoeugenol</b> (blind study)	97-54-1	175*	315	35	<b>CD54</b>	3 out of 3	34.2	59.6	<b>9.6</b>	<b>moderate</b>
<b>Coumarin</b> (blind study)	91-64-5	150*	938	370	<b>CD86</b>	3 out of 3	87.4	140.8	<b>24.6</b>	<b>weak</b>

## Calculation ECΔ300 of CD54 in μM for isoeugenol

ECΔ is calculated from the ΔMFI of the highest concentration below the threshold (a ΔMFI of 300) and the lowest concentration above the threshold by linear interpolation. The mean of three valid runs is calculated

Run1: Highest tested conc. with ΔMFI < 300 at 125 μM, ΔMFI: 114.0

Lowest tested conc. with ΔMFI > 300 at 250 μM, ΔMFI: 307.3

ECΔ300 = 125 μM + [(300-114.0) : (307.3-114.0)] x (250 μM-125 μM) = 245.3 μM

Run2 ECΔ300 = 343.7 μM, Run3 ECΔ300 = 356.4 μM

mean: (254.3+343.7+356.4)/3 = 315 μM

\*molecular weight adjustment as provided with coded chemicals for blind study (MW are 164.2 and 146.15 for Isoeugenol and Coumarin respectively)

# DC-ITS to estimate potency

- DC ITS SkinSens online tool is publicly available at <http://its.douglasconnect.com> and refers to Jaworska et al., 2015
- Bayesian integrated testing strategy using
  - physical-chemical properties
  - *in silico* predictions for bioavailability
  - *in vitro* data from DPRA, KeratinoSens and/or h-CLAT.
- TIMES predicted sensitization potential of 3 classes (non-sensitizer, weak, or moderate/strong) based on the most potent among parent compound and metabolites including consideration of activation (pro-haptens) as well as auto-oxidation (pre-haptens) and protein binding alerts
- builds a hypothesis also with partial data only
- provides prediction confidence ranges including an assessment of the evidence for acceptance by Bayes factors (Bayes factor of 3 indicates that the empirical data is 3 times more probable to fall in one sensitizer potency class compared to the others)
- Application examples in Goebel et al., 2017 in COTOX

## Calculation ECΔ300 of CD54 in μM for isoeugenol

ECΔ is calculated from the ΔMFI of the highest concentration below the threshold (a ΔMFI of 300) and the lowest concentration above the threshold by linear interpolation. The mean of three valid runs is calculated

Run1: Highest tested conc. with ΔMFI < 300 at 143.9 μM, ΔMFI: 114.0

Lowest tested conc. with ΔMFI > 300 at 287.8 μM, ΔMFI: 307.3

ECΔ300 = 143.9 μM + [(300-114.0) : (307.3-114.0)] x (287.8 μM-143.9 μM) = 282.4 μM

Run2 ECΔ300 = 395.6 μM, Run3 ECΔ300 = 410.3 μM

mean: (282.4+395.6+410.3)/3 = 362,7 μM

## Conversion μM to % for eugenol (M=164.2 g/mol)

100 μM Eugenol (M=164.2 g/mol)

100 μM x 164.2 g/mol = 16420 μg/L

16420 μg/L : 10<sup>6</sup> = 0.01642 g/L

0.01642 g/L / 1000 x 100 = 1.6 x 10<sup>-3</sup> %

## Conversion μM to μg/cm<sup>2</sup> explained by the example of eugenol (M= 164.2 g/mol)

The assay volume in the 96 well is 0.18 ml and the growth area is 0.29 cm<sup>2</sup>

100 μM Eugenol (M=164.2/mol)

100 μM x 164.2 g/mol = 16420 μg/L

16420 μg/L : 1000 = 16.42 μg/ml

16.42 μg/ml x 0.18 ml : 0.29 cm<sup>2</sup> = 10 μg/cm<sup>2</sup>
